Why Water Treatment?

Four things water does to a system nobody treats.

THE CASE IN TWO LINES

Every dollar in a cooling or heating system is sitting in water, and left alone, water goes to work on the metal.

The equipment, the energy bill and the people in and around the building all ride on the same program.

Treat the water and you protect all of it.

WHAT EACH ONE DOES

- ✓ Corrosion is what water does to metal
- ✓ Scale is makeup minerals coming back out
- ✓ Bacteria turn a tower into a liability
- ✓ Algae grows wherever light meets water
- ✓ Dissimilar metals attack each other
- ✓ It cuts efficiency and hides corrosion
- ✓ Colonization has to be held to a minimum
- ✓ Left alone, it feeds every other problem

THE FOUR PROBLEMS AT A GLANCE

Corrosion

Water meeting metal, and metal meeting metal.

Eats equipment from the inside.

Bacteria

Colonies wherever water is warm and still.

The way a tower becomes a liability.

Scale

Makeup minerals settling on hot surfaces.

Taxes efficiency, hides corrosion.

Algae

Growth wherever light meets water.

Feeds every other problem here.

Month to Month. No Lock-In.

RSI works month to month. The result has to earn the renewal every time, which is exactly how we like it.
